Local evidence changes action: two distinct implementations

Actual chosen contacts supply feedback; hidden relations are not inputs.

A Fixed units: delayed chosen contact

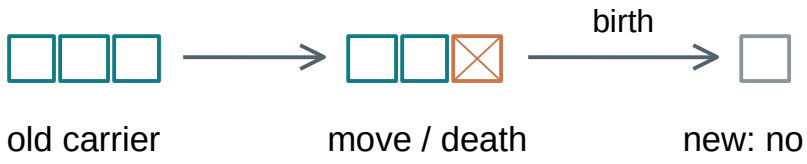

Illustrative unit; cue +1, choose right

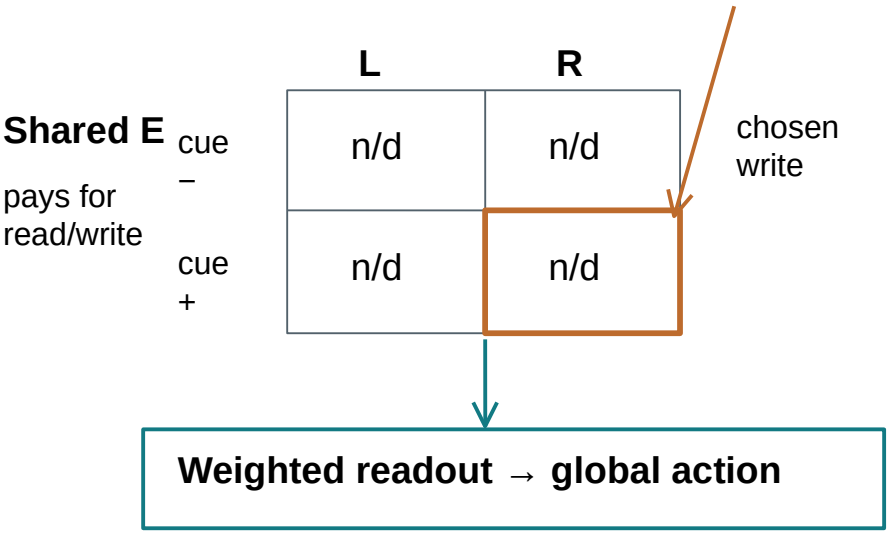

Actual [2,2], same cue: 25→27 left hit; 72→74 right hit.
Illustrative recorded contacts; token-priced prototype.

B Carried evidence: hand-set n / d

α = 0.4 or 1; shared energy / global action

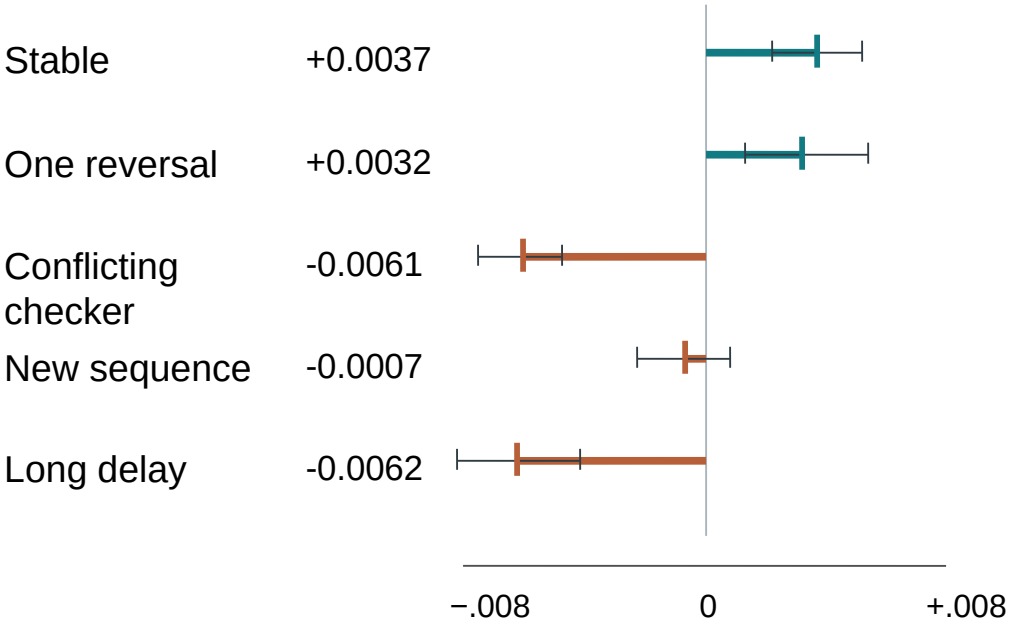

Local uptake on eligible old survivors
updates only the selected cue / action channel

Unchosen actions unknown; no borrowed field tested here.

C Small gains, context-dependent costs

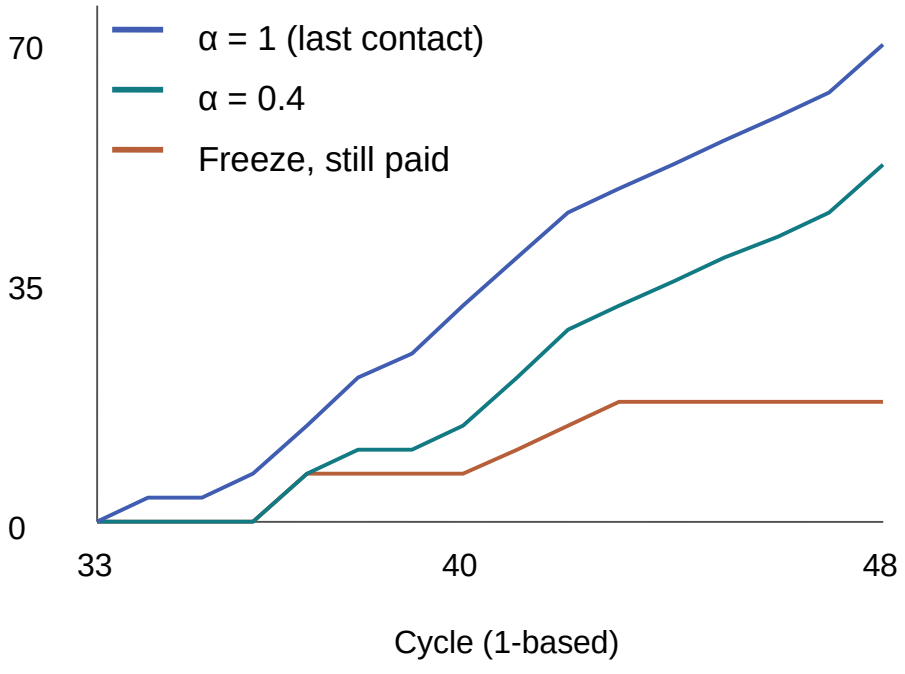

Communication − same-rule no exchange
Mean paired difference across 12 fresh worlds

Net tokens/action; exploratory 95% paired intervals
Twelve shared worlds; conditions are dependent.

D Recent feedback corrects sooner

Host reversal: cumulative uptake (EU)
Mean of 3 shapes × 2 seeds; dependent contexts

α = 1 corrects sooner in this test.
Higher uptake is not sustained energy balance.

Distinct implementations and cost units; neither test establishes a unified algorithm or Lenia adaptation.
