A Further updating is tested from acquired bodies, not stable forms

Three origins · stripe histories shown · initial M = 24, E = 14.4 EU

Fixed windows; lower row wraps across y = 0.

Complete acquired state at 512

Body + reserves + carried controller fields

Unchanged future

Same resource position
Continuous access

Jointly changed future

Stock / support: +8 x cells
Open 16/64, then 16/128
No replenishment

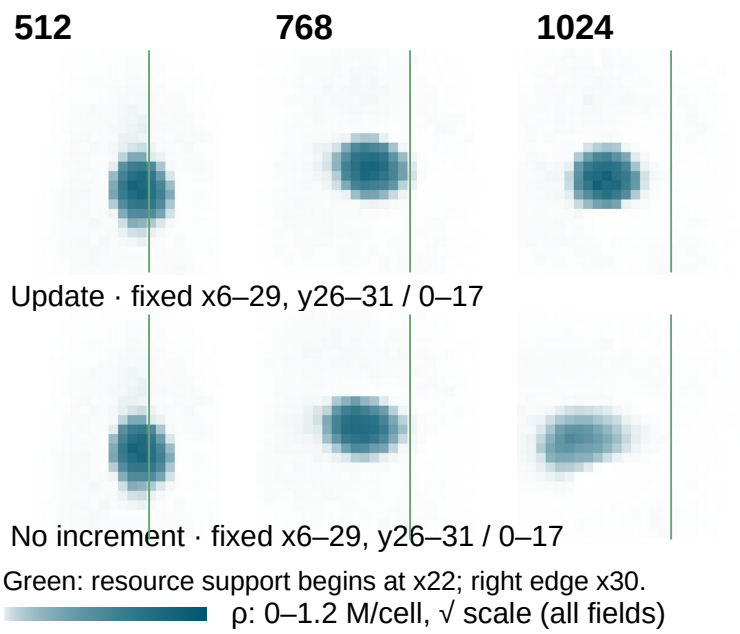

In each future: update θ vs no new θ increments

Critic, recent food and m/z continue in both.
Run / brake, no T controller; brake is not immobility.

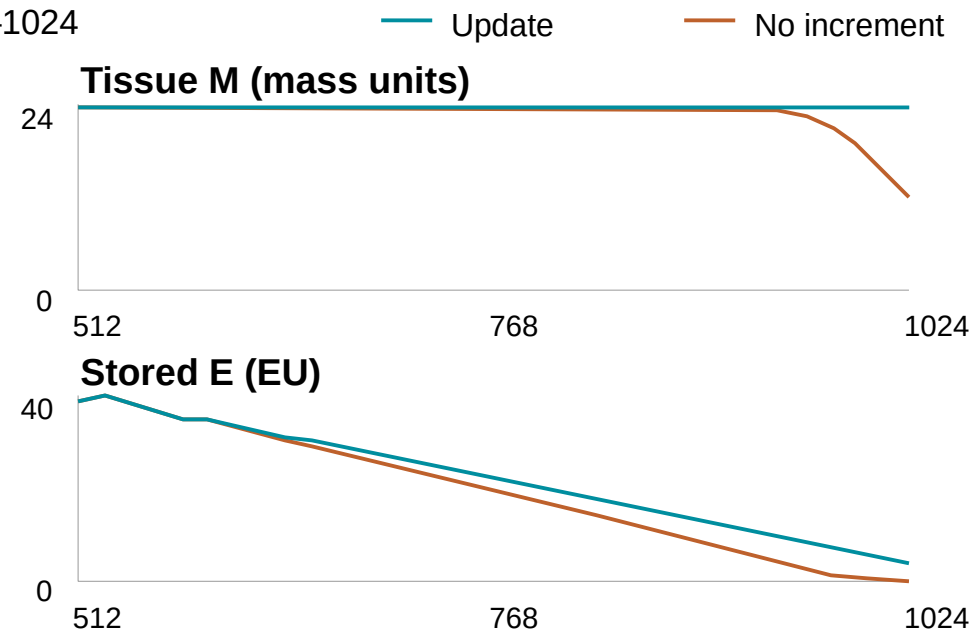

*Annular has different fixed physical rules. First stripe phase: bilobed ΔE = −3.672 EU (update − control).

B More tissue remains, while uptake stalls and reserves run down

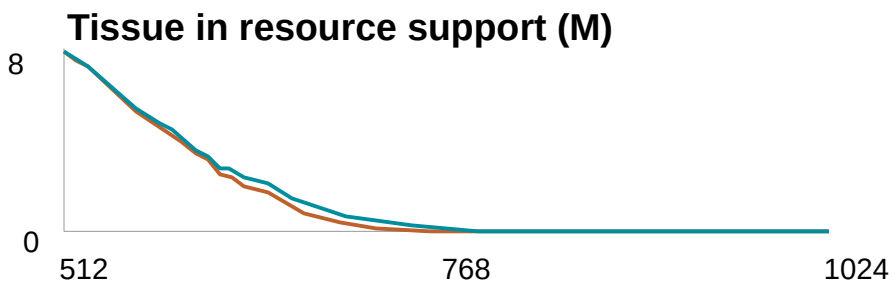

Compact receiver · shifted stock + pulsed access · actions 513–1024

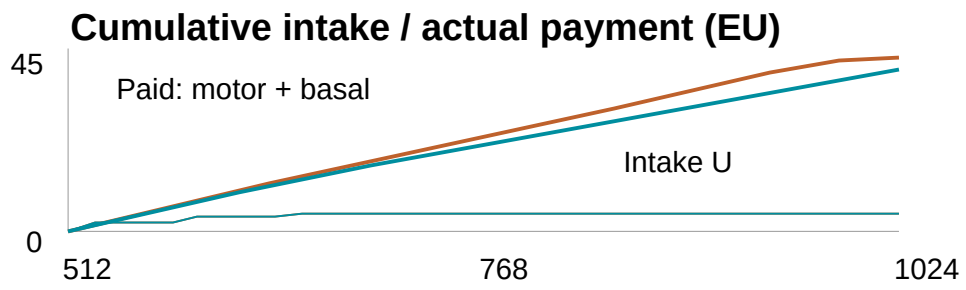

Green: resource support begins at x22; right edge x30.
ρ: 0–1.2 M/cell, √ scale (all fields)

At 1024: M 23.46 / 12.00; E 3.516 / 0.021

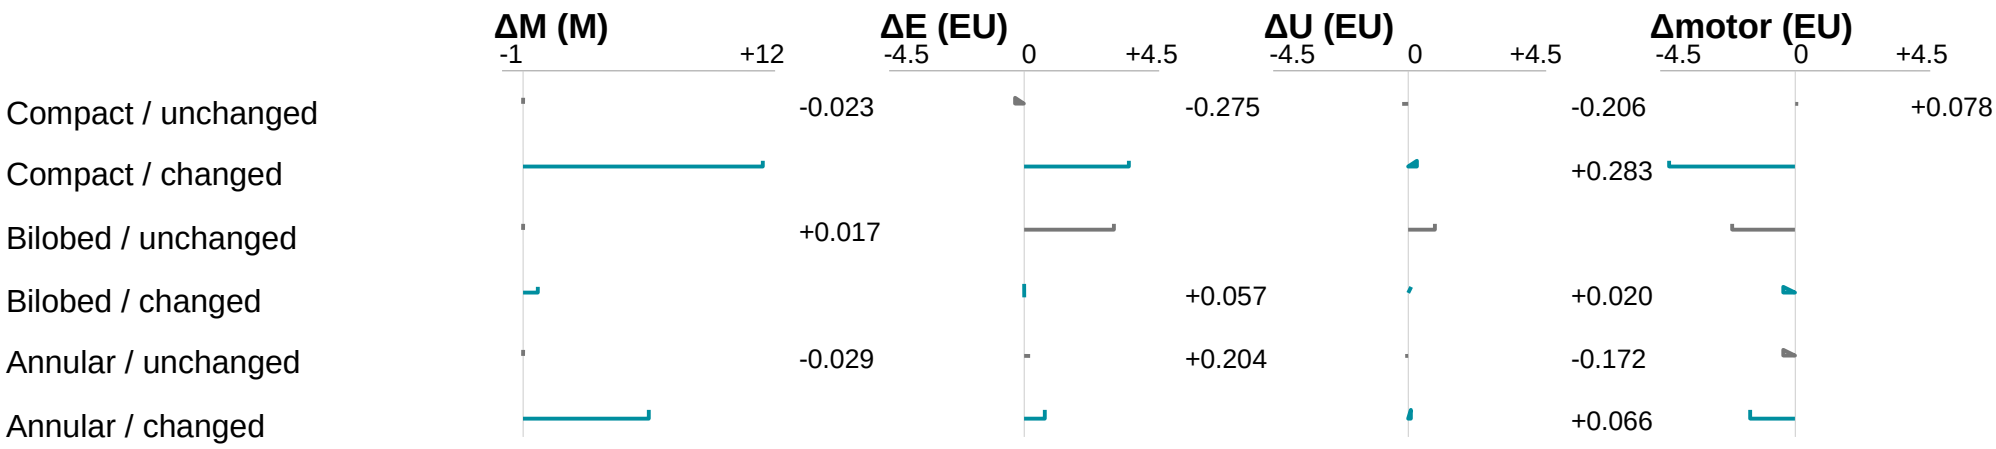

Update: U = 4.636 versus 39.959 EU paid; E falls from 38.840 to 3.516 EU.

C Conditional effects vary across three histories and two futures

At 1024: update − no increment. Grey: unchanged; teal: changed. Negative Δmotor: lower payment.

Changed bilobed: ΔM +0.686, ΔE +0.057 EU. Energy-valued effects share one scale.

Three acquired receiver histories, not 12 independent histories; not an acquired-versus-naive test.
