A Protection persists after its cutoff cohort disappears

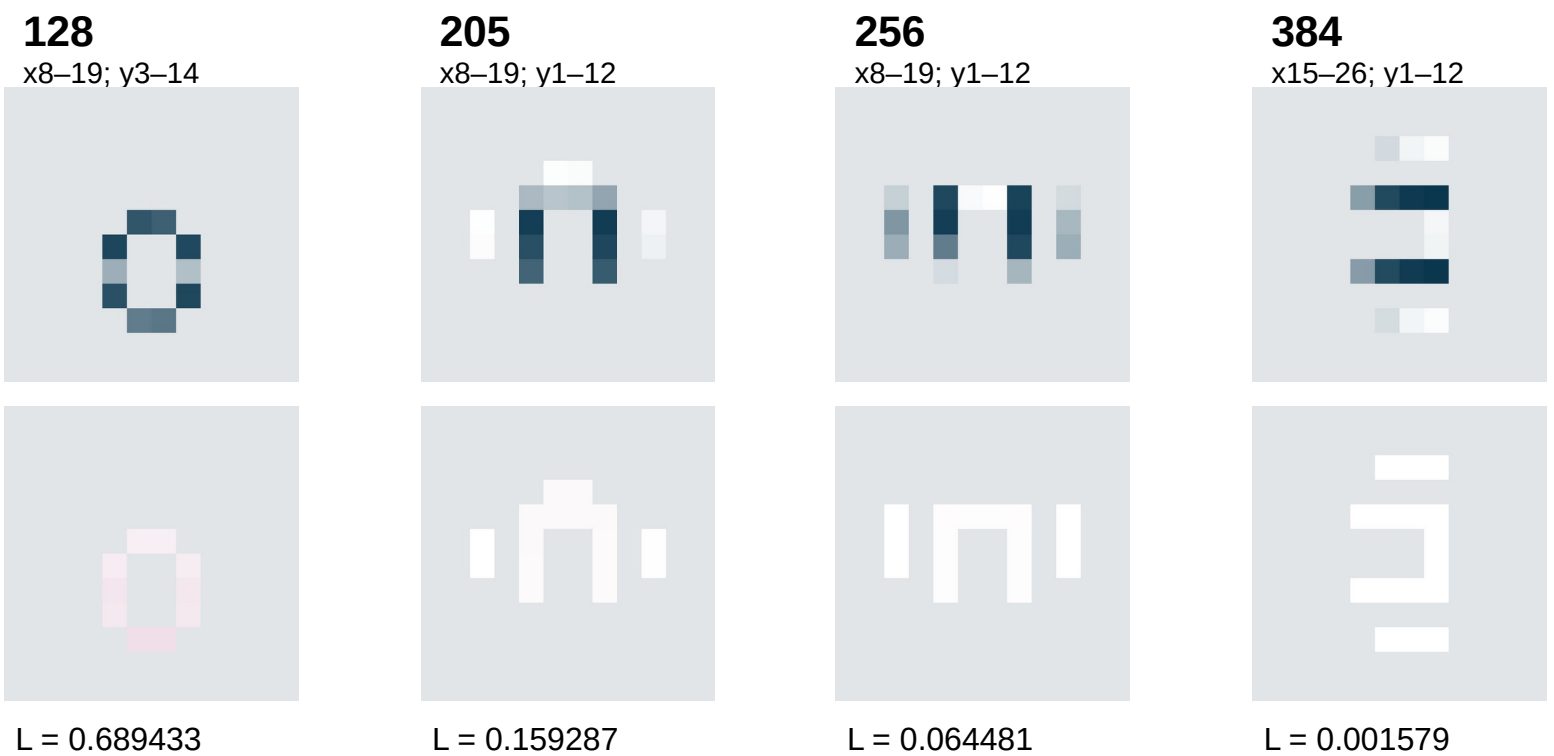

Unequal-peaks receiver · retain + paid copy · further induction off from 128

Body density ρ

0–1 M/cell
linear

Protection a

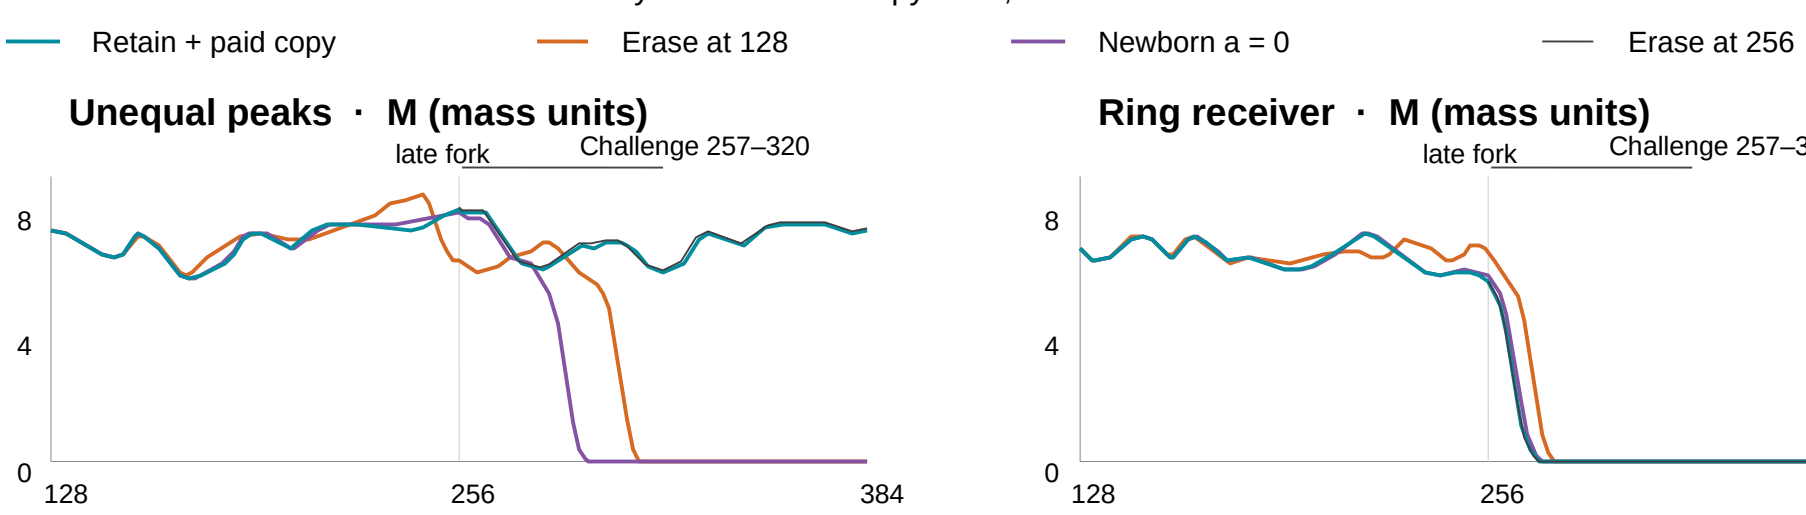

0–1, linear
Grey: ρ = 0

Cohort = all tissue at 128; exactly zero from 205. L = Σρa over the full domain; faint a is not zero.

B Early and late erasure test different reached bodies

128: all three arms reset x. 256: erase a only from retained-copy state; no refund.

Early erase: ×313; newborn-zero: ×296

Retained / late-erased at 384:

M 7.336560 / 7.329940
E 3.162447 / 3.159971 EU · both present

Cohort gone at 219; L = 0.179141

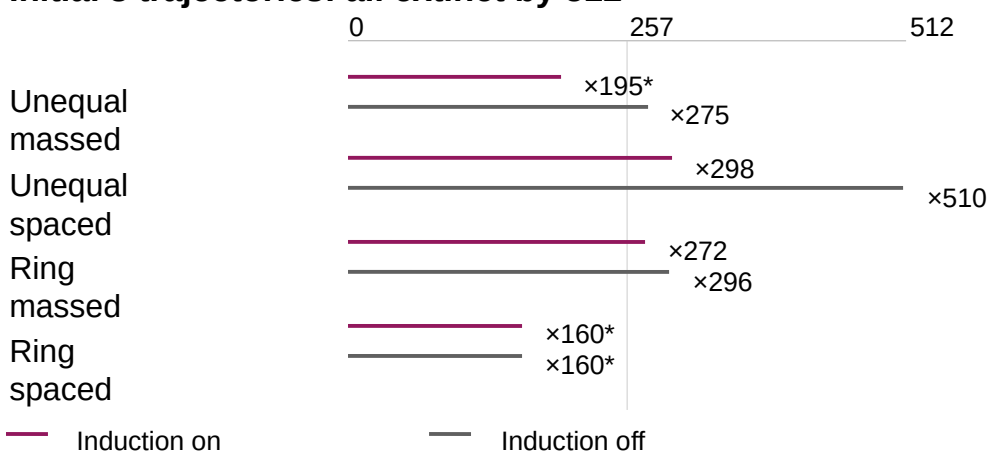

Copy: ×272; early erase: ×277

Newborn-zero: ×273; late erase: ×272
All four end at M = E = 0.

Retain / late-erase curves nearly overlap; a nonzero endpoint effect is not a survival requirement.

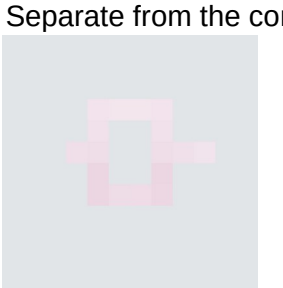

C Retained protection does not guarantee birth opportunity

Initial 8 trajectories: all extinct by 512

Original massed unequal-peaks trajectory

Separate from the continuations in b

a at state 183
x8–19; y3–14

Action 184: H+ request = 0

Input M = 4.849532
Input L = 0.686248

195: rule death removes the remaining tissue.

No basal shortfall or starvation.
These stages do not identify a mediator.

* Three already empty before challenge 257.

Paid order: upkeep → death → uptake → induction → birth + encoding. Separate fixed-plasticity model.
